PROJECT PROPOSAL

DESIGN AND DEVELOPMENT OF AN INFORMATIVE WEBSITE FOR THE DANGOTE EAST AFRICA PETROLEUM REFINERY PROJECT IN KENYA

STUDENT NAME: Victor Mwangi Muriuki

REGISTRATION NUMBER: 24/00532

SUPERVISOR: Geoffrey Rumbe

COURSE: DBIT – Project

YEAR: 2026

1. BACKGROUND

The Dangote East Africa Petroleum Refinery is a major industrial project being developed in Lamu County, Kenya. The project was officially launched through a groundbreaking ceremony in September 2026 and is planned to have a processing capacity of about 700,000 barrels of crude oil per day. The wider project is also expected to include facilities such as a power plant, fertilizer and chemical manufacturing facilities.

The refinery is expected to contribute to Kenya's energy security, create employment opportunities and support the growth of industries and businesses in Lamu and other parts of the region. It is also connected to the wider LAPSSET development and is expected to increase economic activities around Lamu Port.

However, information about the project is available from different sources, including government websites, news platforms and other online sources. This can make it difficult for students and members of the public to find basic information about the project in one place. The proposed project will therefore focus on creating a website that organizes this information in a simple and accessible way.

2. PROBLEM STATEMENT

The Dangote refinery project is a major development that has attracted interest from Kenyans and other people in East Africa. However, information about the project is scattered across different websites and sources.

A person who wants to learn about the refinery may have to search through several websites to find information about its location, facilities, benefits and progress. This can be time-consuming and may make it difficult for users to get a clear understanding of the project.

There is therefore a need for a simple website that brings important information about the Dangote East Africa Petroleum Refinery together in one place.

3. PROPOSED SOLUTION

The proposed solution is to develop an informative website about the Dangote East Africa Petroleum Refinery Project.

The website will provide information about the background of the project, its location, major facilities, expected economic benefits, environmental and social aspects, and development progress.

The website will have simple navigation so that users can easily move from one section to another. It will also include images and other visual information to make the content easier to understand.

The website will mainly be developed using HTML, CSS and JavaScript, with PHP and MySQL considered where necessary.

4. PROJECT OBJECTIVES

4.1 General Objective

To design and develop an informative and user-friendly website that provides information about the Dangote East Africa Petroleum Refinery Project in Kenya.

4.2 Specific Objectives

1. To provide background information about the Dangote East Africa Petroleum Refinery Project.

2. To provide information about the location and major facilities of the refinery.

3. To provide information about the expected economic and employment benefits of the project.

4. To provide information about the environmental and social aspects of the project.

5. To provide updates on the progress and development of the refinery.

6. To develop a simple and responsive website that can be accessed using computers and mobile phones.

5. LITERATURE REVIEW

Different sources have provided information about the Dangote refinery project and its expected contribution to Kenya's development. Government sources indicate that the refinery is expected to strengthen the country's industrial and energy sectors and support economic activities in Lamu.

The Special Economic Zones Authority has also identified the refinery as an important investment within the LAPSSET Special Economic Zone. The project is expected to support employment and create opportunities for businesses in areas such as manufacturing, logistics and engineering.

Existing online sources provide useful information, but the information is spread across different platforms. This project will organize the available information into one website where users can easily find the main information about the refinery.

6. SIGNIFICANCE OF THE STUDY

The project will make information about the Dangote refinery easier to access and understand.

Students and researchers will be able to use the website to learn about the refinery and its role in Kenya's petroleum and industrial sectors. Members of the public will also be able to find basic information about the project without searching through many different websites.

The project will also help the student apply skills learned in DBIT, including web design, programming, system analysis and testing.

7. METHODOLOGY

7.1 Research Methodology

Information for the project will mainly be collected through online research. Government websites, official publications, news sources and other reliable sources will be used to obtain information about the refinery.

The information collected will then be analyzed and organized according to the different sections of the website.

7.2 Development Methodology

The development process will involve identifying the website requirements, designing the pages, developing the website, testing the system and making the necessary improvements.

HTML will be used to create the structure of the website, CSS will be used for the design and layout, while JavaScript will be used to add interactive features. PHP and MySQL may be used if database functionality is required.

8. BUDGET AND RESOURCES

The project will require a computer for development and testing and an internet connection for research and development.

The estimated expenses are:

Internet and research – KSh 1,500

Domain and hosting if required – KSh 2,500

Printing and documentation – KSh 1,000

Miscellaneous expenses – KSh 1,000

Estimated Total: KSh 6,000

Most software required, such as Visual Studio Code and web browsers, will be free.

9. PROJECT SCHEDULE

Week 1: Research and collection of information.

Week 2: Requirements gathering and proposal preparation.

Week 3: Website planning and interface design.

Week 4: Development of the main website pages.

Week 5: Adding content, images and interactive features.

Week 6: Testing and correction of errors.

Week 7: Final improvements and documentation.

Week 8: Final testing, presentation and submission.

10. CONCLUSION

The proposed project will develop an informative website that brings together important information about the Dangote East Africa Petroleum Refinery Project in Kenya.

The website will help solve the problem of scattered information by providing information about the refinery in one organized platform. It will also give the student an opportunity to apply DBIT knowledge in web development and create a practical system based on a real project in Kenya.
